## Maxima Minima of function of Several Variables

### Critical Points

A point  $(x_0, y_0)$  in the domain of a function  $f(x, y)$  is called a critical point of the function.

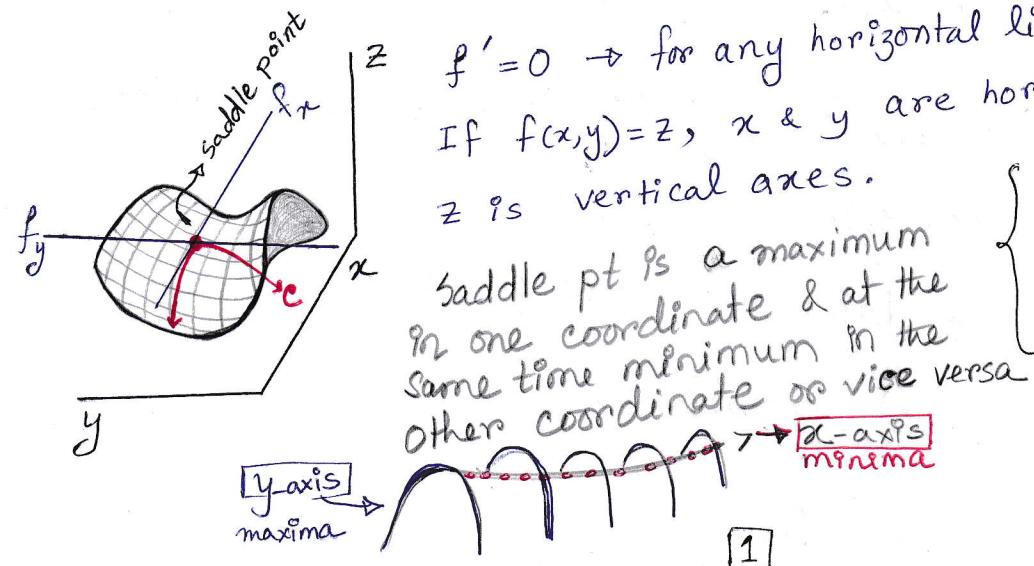

if  $f_x(x_0, y_0) = 0$  and  $f_y(x_0, y_0) = 0$

OR

if  $f_x(x_0, y_0) = \infty$  and  $f_y(x_0, y_0) = \infty$

### Saddle Point:

A saddle point is a point in the domain of a function that is a stationary point but not a local extremum on both axes (x & y axes).

$f' = 0 \rightarrow$  for any horizontal line  
If  $f(x, y) = z$ ,  $x$  &  $y$  are horizontal axes.  
 $z$  is vertical axes.

saddle pt is a maximum in one coordinate & at the same time minimum in the other coordinate or vice versa

Other coordinate  $\rightarrow$   $\text{y-axis maxima}$   $\rightarrow$   $\text{x-axis minima}$

[1]

$$\left\{ \begin{array}{l} f_x(x_0, y_0) = \infty \\ f_y(x_0, y_0) = \infty \\ \text{or both } \infty \end{array} \right.$$

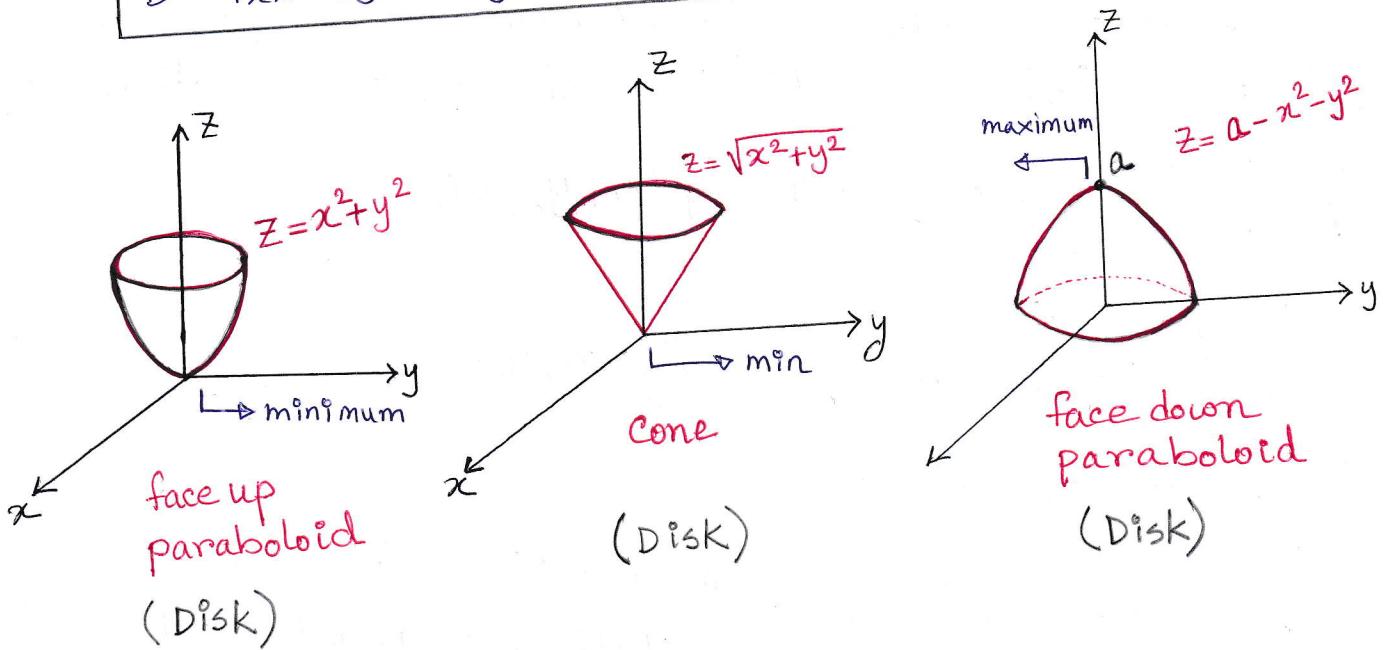

$\downarrow$   
These conditions are not covered in saddle point.

## The Second Partial Test

Let  $f$  be a function of two variables with continuous second-order partial derivatives in some disk centered at a critical point  $(x_0, y_0)$  and

let  $D(x_0, y_0) = f_{xx}(x_0, y_0)f_{yy}(x_0, y_0) - f_{xy}^2(x_0, y_0)$

$$D = f_{xx}f_{yy} - f_{xy}^2 \text{ at } (x_0, y_0)$$

- a) If  $D > 0$  and  $f_{xx}(x_0, y_0) > 0$  then  $f$  has a relative minimum at  $(x_0, y_0)$ .
- b) If  $D > 0$  and  $f_{xx}(x_0, y_0) < 0$  then  $f$  has a relative maximum at  $(x_0, y_0)$ .
- c) If  $D < 0$  then  $f$  has a saddle point at  $(x_0, y_0)$ .
- d) If  $D = 0$  then no conclusion
